# Managing Rich Link Preview Content

### **Prompt**

Determining what gets served up to the user when a link is displayed as a Rich Link.

### Outcome

With the pre-formatted advance styling of Rich Links, content details are "pushed" to a page from another linked page. (This can greatly enhance the user experience, adding contextual information where it's needed, without weighing a page down unnecessarily.)

When a Rich Link is displayed on a page, Theme Press looks for the following information from the linked page:

- Title
- Description
- Image
- Space name
- Space icon

### Steps

#### Select a block on the linked page to serve up Rich Link content

Any block on a page can be designated for Meta Properties. This is the first place Theme Press will look for metadata to display within the Rich Link preview.

#### No Meta Properties block selected?

Theme Press will cascade through the following areas if no block on the page has been selected.

#### Image

- 1. Attachment with the label "rich-link"
- 2. Image in an excerpt macro
- 3. Any attached image

#### Title

1. The page title

#### Description

- 1. The text from the first paragraph in the Excerpt macro on the page
- 2. The text from the first paragraph in the first Content Block on the page
- 3. The text from any paragraph in the page body

Note: A rich link will only display one paragraph of text in the description and will not pull content from multiple paragraphs.

#### Note

## Tip

#### **High-touch Rich Link Previews**

For tight control over Rich Link preview display, you can create a 'hidden' block that exists only to serve up curated preview content. To do so:

- Check the **Meta Properties** box for this block.
- Set Initial Display to collapse.
