What is Theme Press?

Theme Press works seamlessly with Atlassian Confluence to create on-brand beautifully designed sites that engage users. Build dynamic, interactive homepages that showcase messaging and encourage browsing. Connect users to the right people, information, and processes with easy-to-use navigation and authoring tools. Theme Press removes barriers to adoption by letting users make design and content changes without programming. With Theme Press you can transform the look and functionality of your Confluence knowledge bases, intranets, websites, and portals.
How Theme Press Works

Theme Press gets you up-to-speed fast and easy. With one click, you can create a new intranet space, complete with example pages to explore and modify.

Theme Press is an app for creating on-brand beautiful themes (applied site-wide or by space), transforming your existing content and making new content creation easier and more consumable. Additionally, it is a per-page design app, offering highly customizable consumer-grade design functionality.

The app uses easy-to-edit template pages that define and format page elements, including options for header, footer, and banner areas. These pages can be copied, renamed, modified, and used as formatting alternatives, for an entire space or on a page-by-page basis.

What You Can Do

Brikit Theme Press provides beautiful, consistently branded site design, allowing content to become friendlier and more accessible to users.
Create different layouts to display your content most effectively.

Arrange content in multiple columns and blocks, instead of a single block, harnessing design hierarchy to help your users find what they need.

Manage color palettes, font selection, and UI styles to match your visual identity.

Change out logos to control your brand.

Customize menus to provide effective navigation.

Design for mobile and accessibility.

Implement Theme Press macros for powerful, controlled content display and access.

**How Theme Press works**

Theme Press gets you up-to-speed fast and easy. With one click, you can create a new intranet space, complete with example pages to explore and modify.

The app uses easy-to-edit template pages (called architect pages) that define and format page elements, including separate ones for the header, footer, and banner areas. These pages can be copied, renamed, modified, and then used as formatting alternatives, for an entire space or on a page-by-page basis. Menus are also defined by architect pages, and both menu style and choices can be easily customized.

With Theme Press, you have a page (a layout architect page) that defines the structure of your content display. You can change the layout from a single content block (the Confluence default) to whatever combination of blocks, columns, and layers suits your content best. With the readily available Theme Press Control Panel, users can define what page elements are visible in the layout, such as breadcrumbs; page title; likes & labels; etc.

Layouts can include pre-configured content and structure so that a user’s new pages are consistent with existing content. Using pre-built and easy-to-use code tools (macros), pages can dynamically include pre-labeled content from across your site in real time. Other macros can do everything from basic formatting to advanced searching—allowing users to build out rich pages and content easily as they grow more comfortable.

The Theme Designer lets you engage in theming—working with color palettes, fonts, and logo placements—to visually design pages that best reflect your company's brand. You can move objects such as the search bar, menus, header, footer, page title, and others to create a comfortable, functional, and consistent look-and-feel.
