TARGETED SEARCH

Filter Groups

Prompt

Custom groups of predefined labels for organizing and filtering site content. Also called filter categories.

Definition

Filter groups are collections of [Brikit Targeted Search filters](#) that are categorized by you.

Filter groups:

- Organize filters into meaningful categories
- Can be nested into [hierarchical subcategories](#)
- Enhance searching and discovery by grouping filters

Keeping filters/labels organized in groups gives shape and structure to your site's [taxonomy](#), which would otherwise be a flat list of terms. This can make labeling content easier, and more so if the filter groups you define reflect naturally occurring, recognizable aspects of your organization.

Filter groups also allow you to [control the visibility and availability of filters](#) in certain contexts based on which group they belong to, for both labeling content as well as filtering search results. In other words, you decide whether a filter group appears in a [space](#) or not.
