BLUEPRINT MAKER

Space Blueprints

Prompt

A [Blueprint](#) of a Confluence space that allows you to create pre-formed spaces easily and efficiently.

Definition

Brikit Space Blueprints are a type of [Blueprint](#) whereby an entire space is used as the standardized form, and from which new spaces can be easily stamped out. The Space Blueprint is the archetype for the look and feel of all the subsequent spaces that are to be created from this Blueprint. This also includes any pages within the Space Blueprint, for these are copied into the stamped out spaces as well.

Space Blueprints are particularly powerful when using [substitution fields](#) on its child pages. Substitution fields enable the stamped out space to be pre-populated with unique content. This means that you can rapidly spin up a Team Space, for example, and pre-populate the space name and any pages with a particular team's name.
