Page Blueprints

Prompt

A [Blueprint](#) used to quickly and easily create standardized copies of a Confluence page.

Definition

Brikit Page Blueprints are a type of [Blueprint](#) from which users can stamp out standardized copies. The Blueprint is your archetype page; it is the source and form of how you want pages made from it to look and feel. Page Blueprints are particularly powerful when using [substitution fields](#), allowing the pages made from this Blueprint to be pre-populated with unique content.

Page Blueprints reduce duplication and facilitate the reuse of content structures, making them a critical tool for quickly creating common pages like Meeting Notes, Employee Profiles, Policy pages — virtually any page that has a standardized style and structure.

Info

Brikit recommends putting all of your site's Page Blueprints in one or more dedicated spaces. This makes it easy to find them again and also to manage permissions for the appropriate editors.
