

Changing the Confluence Default Theme

Requires

THEME PRESS

Changing the Confluence Default Theme

Prompt

Determining at a high level the look and feel across your site.

Outcome

Out of the box, Confluence uses a default Confluence look and feel for this setting. You can override this at the site level, by changing the [Confluence Default Theme](#). (Or, at the space level, by changing any space's look and feel.)

Choosing the appropriate setting for the [Confluence Default Theme](#) is an important first step when using Theme Press in your Confluence instance. The word [theme](#) in this case is used by Atlassian to define a theming add-on, like Theme Press.

Steps

Navigate to the Themes area in Confluence Administration

Confluence Administration General Configuration Look and Feel Themes

To Apply Theme Press to all spaces in your site:

Select **Brikit Theme Press** as the **Current Theme**.

To apply Theme Press only to specific spaces in your site:

Select **Default Theme** as as the **Current Theme**. Then, follow the instructions in [Applying a Theme to a Space](#).
