

Enabling and Disabling the Theme Designer

Requires

THEME PRESS

Enabling and Disabling the Theme Designer

Prompt

Accessing all of your options for [theme design](#) and management.

Outcome

Managing and modifying [themes](#) requires you to enable the [Theme Designer](#).

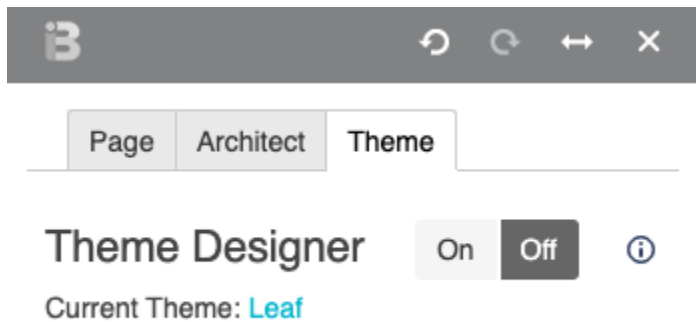

Steps

Navigate to the Theme tab in the Theme Press Control Panel

[Access the Theme Press Control Panel](#) and select the Theme tab.¹

Toggle the Theme Designer On or Off

Use the On/Off buttons to enable/disable this menu.

If you are turning the Theme Designer on, you will see a warning message about how enabling these features will increase the performance load on the server.² Review the message and click the "I understand..." checkbox to continue.

Info

 ¹Only authorized users may access the Theme Designer.

Note

 ²Theme Press recalculates look-and-feel information every time a change is made in the Theme Designer (and also when responding to a **force reload** in most browsers).

These recalculations add to the performance load on the server.

For this reason, **we recommend that you only design themes in a test or development environment**, rather than in a production environment.
