

Deferred Block Loading

Relates To

THEME PRESS

Deferred Block Loading

Prompt

A block-level option for decreasing page load times, by specifically targeting blocks containing slow-loading content.

Definition

When pages contain complex blocks of content, it can sometimes be beneficial to render the content after initial page display, in order to improve page load times.

When [this setting is invoked](#), rather than rendering [block](#) contents with the initial page load, a second call is sent to the server to then render the selected deferred-content block.
