

Positioning Content

Requires

THEME PRESS

Positioning Content

Prompt

Styling content presentation through the arrangement of [blocks](#) and [layers](#).

Outcome

Options in the Page Designer for sizing both margins and padding allow for fine-tuning of page designs, and customizing alignment without needing to add custom code.

Steps

Click on a block or layer in the [Page Tab](#).

Open the Size expander.

Add values to adjust the pixel values for margin and padding.

- **Margin:** creates space **around** layers and blocks
- **Padding:** creates space **within** layers and blocks

Learn more about these values and how they are used: [CSS Box Model](#)

Note

Tip

Pro Tip

Negative values can be set for margins to achieve overlapping of content. For example, if a -20px top margin is applied, that will move the element 20px towards the top of the page. A bottom margin of -20px will move content following that element 20px closer vertically.
