TARGETED SEARCH

Promoting a Folksonomy Label into the Taxonomy

Prompt

Convert your [folksonomy](#) label into an official [taxonomy](#) filter.

Outcome

Folksonomy labels, AKA 'unofficial' user-created and applied labels, vary in quality and the degree to which they help users understand and find content. Some folksonomy labels are downright awful, but some may be recognized for adding valuable descriptive or functional 'aboutness' to a piece of Confluence content, such as a page, blog, or attachment. You may want to take one of these beneficial folksonomy labels and add it to your official taxonomy, meaning your Targeted Search [filters](#) and [filter groups](#).

Steps

Navigate to the Folksonomy Page

The [Folksonomy Page](#) is used for tracking, managing, and promoting folksonomy labels. You can also [replace old labels with new labels](#) on this page.

Find the label you want to promote

In the list of folksonomy labels, locate the label that you want moved to the taxonomy.

Click 'Promote' and enter data

You will be prompted to choose the [Filter Group](#) into which this promoted label will go. If there is not an appropriate filter group, first [create a new filter group](#), then come back to this page.

Confluence administration

Manage Folksonomy

Label	Page Count	
Julia	10	Ignore Promote Replace
andytest	0	Ignore Promote Replace
bitan	10	Ignore Promote Replace
essential	14	Ignore Promote Replace
hato	2	Ignore Promote Replace
highlight	4	Ignore Promote Replace
kevin	10	Ignore Promote Replace
linda	10	Ignore Promote Replace
news	9	Ignore Promote Replace
phiboard	9	Ignore Promote Replace
rich-link	6	Ignore Promote Replace
spinach	1	Ignore Promote Replace
team-member	8	Ignore Promote Replace

Filter Group: Application
Filter Name: A human-friendly name
Promote Cancel

Replace Any Label

Old Label: ent-relations
New Label: new-label
Replace Cancel

Next enter a human-readable name for your promoted label. With Taxonomy filters, Targeted Search makes it possible to see display names as opposed to the filter name. For example, instead of a label like "ent_relations" a taxonomy label will be presented with its display name, such as "Enterprise Relations".

Click 'Promote'

Your former folksonomy term will now be managed and tracked on [the Search Filters page](#).
